1. The script asks for the action “jump” instead of checking the Space key directly. What would you have to change if a player wanted a different key?

If the player wanted to use a different key, I would go to Project Settings and change the key assigned to the “jump” action in the Input Map. I wouldn't need to change the script because it already uses the action name instead of a specific key.

2. When would you choose solid collision (a CharacterBody2D meeting a StaticBody2D) and when an Area2D overlap sensor? Give one example of each from a game you have played.

I would use solid collision when the player needs to be stopped by an object, such as walking into a wall in Minecraft. I would use an Area2D overlap sensor when the game needs to detect contact without physically blocking the player, such as picking up an item in Minecraft. In our Godot activity, we also used Area2D to detect when the player touches the enemy and send the player back to the starting position.
